

PM 5.0 Week-3 assignment

Objective :

Make a working prototype of the [Week-1 assignment](#) using Lovable

Tasks

1. Put all your features in ChatGpt and tell it to generate a detailed PRD for Lovable to use.
2. Put this PRD in [visily.ai](#), to get a feel of how the UI of your app would look like. Why is this important? Because when iterating in Lovable, it acts as a reference UI design, thus leading to better prompts and less guesswork. You can also put these UI pictures directly into Lovable (Note: I don't recommend this because at times, Lovable struggles to generate a replica and may lead to wrong designs and a lot of iterations to fix.)
3. Put the PRD in Lovable
4. Iterate it as per your wish (Bonus Tip : You only get 5 free credits per day which is very less, so click on "Get free credits" on top right of the page and use your alternate email for the referral link or buy 25\$ monthly subscription)

Marking Scheme

1. Good, clean UI/UX
2. Interactive prototype (more interactive = more points)
3. End-to-end app

Note

1. We don't need backend integration, just publish the prototype and attach link
2. One more important Tip: I don't want you guys to waste time, so whenever writing any prompts for iterations in Lovable, put it in ChatGpt and tell it to make it detailed for Lovable use.(This prevents a lot of miscommunication with Lovable, but make sure you go through the ChatGpt generated prompt as it can include extra, non-related stuff as well.)

Deliverables

1. Final Lovable Prototype link
